PURE FORCE

Consistently high torque ratings, numerous close progression ratios, various mounting options along with compact dimensions to ease the application engineering to unmatched levels. The rigid monobloc gear case and the gears' high class of precision yield an extremely quiet and vibration-free operation. For more information:

1 GENERAL INFORMATION

1.1 SYMBOLS AND UNITS OF MEASUREMENT

Symb.	U.m.	Description	Symb.	U.m.	Description
An_{1,2}	[kN]	Permissible axial force	Mr_{1,2}	[Nm]	Torque demand
f_s	-	Service factor	n_{1,2}	[min ⁻¹]	Speed
i	-	Gear ratio	P_{1,2}	[kW]	Power
l	-	Cyclic duration factor	P_{n 1,2}	[kW]	Rated power
J	[Kgm ²]	Mass moment of inertia	P_{r 1,2}	[kW]	Power demand
M_{1,2}	[Nm]	Torque	R_{c 1,2}	[kN]	Calculated radial force
Mc_{1,2}	[Nm]	Calculated torque	R_{n 1,2}	[kN]	Permissible overhung load
Mn_{1,2}	[Nm]	Rated torque	η	-	Efficiency

□₁ value applies to input shaft

□₂ value applies to output shaft

1.2 PRODUCT FEATURES

Gear units of the HDP series make optimum use of advanced design features, to offer:

- Top torque density
- Superior performance
- Silent and vibration-free operation
- Total ruggedness and reliability
- Lifetime calculation in accordance with the applicable ISO and AGMA standards
- Extensive customisation through a wide range of options offered in the catalogue

The main construction features of the HDP parallel shaft gear unit range are:

- 4 frame sizes: HDP 60, HDP 70, HDP 80 and HDP 90 with 2 and 3 reduction stages
- Optimum distribution of rated torque values across the entire ratio range
- Gear ratios with 12% constant escalation
- Monobloc housing in rigid, nodular cast iron, paint coated both internally and externally. A modern design without recesses for easy cleaning. Universal mounting thanks to the many machined surfaces. Profiles and dimensions optimised by FEM analysis for superior structural rigidity, low acoustic emissions and a moderate weight.
- Casehardened and hardened alloy steel helical gears with ground profile, optimised for:
 - more silent operation and smoother transmission of input gears
 - maximum transmissible torque of the final reductions
- Input shafts generally casehardened and ground finished. Output shafts from hardened and tempered alloy steel.
- Input shaft configurations:
 - solid, single or double-sided shaft with dimensions to UNI/ISO 775-88 (extended length)
 - direct motor mounting or lantern housing and flexible coupling provision
- Output shaft configurations:
 - solid, single or double-sided shaft with dimensions to UNI/ISO 775-88 (extended length)
 - hollow shaft with keyway
 - hollow shaft with shrink disc
- Heavy duty taper roller bearings from the most reputed brands for unparalleled overhung load capacity that can be further increased through the reinforced "HDB" bearing option.
- A wide range of customisation options are available upon request, including:
 - auxiliary cooling/heating devices
 - forced lubrication systems
 - backstop device
 - mounting or manifold flanges
 - bearings for increased overhung load capacity
 - seals of different types and materials
 - sensors
 - dry-well device for vertical shaft installations
 - fixing elements

1.3 INSTALLATION

The following installation instructions must be observed:

- Make sure that the gearbox is correctly secured to avoid vibrations.
If shocks or overloads are expected, install hydraulic couplings, clutches, torque limiters, etc.
- Before being painted, the machined surfaces and the outer face of the oilseals must be protected to prevent paint drying out the rubber and jeopardising the oil-seal function.
- Parts fitted on the gearbox output shaft must be machined to ISO H7 tolerance to prevent interference fits that could damage the gearbox itself. Further, to mount or remove such parts, use suitable pullers or extraction devices using the tapped hole located at the top of the shaft

extension.

- Mating surfaces must be cleaned and treated with suitable protective products before mounting to avoid oxidation and, as a result, seizure of parts.
- Prior to putting the gear unit into operation make sure that the equipment that incorporates the same complies with the current revision of the Machines Directive 89/392.
- Before starting up the machine, make sure that oil level conforms to the mounting position specified for the gear unit.
- For outdoor installation provide adequate guards in order to protect the drive from rainfalls as well as direct sun radiation.

1.4 MAINTENANCE

It is advisable to change the lubricant after the initial 300 hours of operation and thoroughly clean the interior of the unit with a suitable detergent.

Do not mix different types and/or brands of oil.

Periodically check the oil level, and replace at the intervals given in the chart.

Oil temperature [°C]	Oil change interval [h]	
	mineral oil	synthetic oil
< 65	8000	25000
65 - 80	4000	15000
80 - 95	2000	12500

1.5 STORAGE

Observe the following instructions to ensure correct storage of the products:

- Do not store outdoors, in areas exposed to weather or with excessive humidity.
- Always place boards, wood or other material between the products and the floor.
The gearboxes should not have direct contact with the floor.
- In case of long-term storage all machined surfaces such as flanges, shafts and couplings must be coated with a suitable rust inhibiting product (Mobilarma 248 or equivalent).
Furthermore gear units must be placed with the fill plug in the highest position and filled up with oil. Before putting the units into operation the appropriate quantity, and type, of oil must be restored.

1.6 CONDITIONS OF SUPPLY

Gear units are supplied as follows:

- configured for installation in the mounting position specified when ordering;
- tested to manufacturer specifications;
- mating machined surfaces come unpainted;
- nuts and bolts for mounting motors are provided;
- shafts are protected during transportation by plastic caps.

1.7 PAINT COATING

Internal and external paint coating with thermosetting epoxy resin and polyester-based powder with a high corrosion protection rating, also suitable for outdoor installation. Colour is grey RAL 7042. It can be top-coated with synthetic paints.

1.8 SELECTING THE GEAR UNIT

1.8.1 ENGINEERING SELECTION

1. First determine the gear ratio:

$$i = \frac{n_1}{n_2}$$

2. Calculate the power P_{r1} required at the input shaft:

$$P_{r1} = \frac{P_{r2}}{\eta}$$

	η
2x	0.96
3x	0.94

3. Determine the applicable service factor f_s and the adjusting factor f_m depending on prime mover:

	f_m
Electric motor Hydraulic motor Turbine	1.00
Multi-cylinder internal combustion engine	1.25
Single cylinder internal combustion engine	1.50

4. Use the rating charts to select the gear unit with the gear ratio nearest to that calculated, and with a rated power P_{n1} , so that:

$$P_{n1} \geq P_{r1} \times f_s \times f_m$$

1.8.2 VERIFICATIONS

1.8.2.1 SHOCK LOADING

For intermittent duty, impact/shock loading applications or start-ups under full load or with high inertial loads, make sure the following condition is satisfied for momentary peak torque M_p generated during the operating cycle:

$$M_p \leq M_{n2} \times f_p$$

		f_p				
<i>peaks / hour</i>		1	2 ... 10	11 ... 50	51 ... 100	> 100
<i>Drive</i>	Constant direction	2.0	1.6	1.3	1.1	1.0
	Reversals	1.4	1.2	0.9	0.8	0.7

If the above condition is not satisfied, consider installing a torque limiter or selecting a gear unit of the next size up.

1.8.2.2 MOTOR MOUNTING

Verify that the appropriate motor adapter is available for the selected gear unit. See section 2.4. Because of standardisation, the rated power of the electric motor selected might be greater than power P_{r1} actually requested by the application. Make sure that the electric motor will never develop the extra power at any stage of the operating cycle. If you have any doubts about the validity of the application data, or uncertainty concerning the actual load pattern, install a torque limiting device or proportionally revise the applicable service factor.

1.8.2.3 BACKSTOP DEVICE

If the gear unit is specified with a backstop, verify the load capacity of the device in the relevant section of this catalogue and make sure the torque M_{1MAX} is never exceeded in operation.

1.8.2.4 CALCULATING THE RESULTING OVERHUNG LOAD

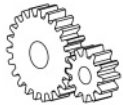

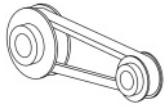

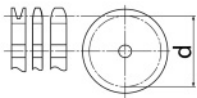

External transmissions keyed onto input and/or output shaft generate loads that act radially onto same shaft.

Resulting shaft loading must be compatible with both the bearing and the shaft capacity.

Namely shaft loading (R_{c1} for input shaft, R_{c2} for output shaft), must be equal or lower than admissible overhung load capacity for shaft under study (R_{x1} for input shaft, R_{x2} for output shaft). OHL capability listed in the rating chart section.

In the formulas given below, index (1) applies to parameters relating to input shaft, whereas index (2) refers to output shaft.

The load generated by an external transmission can be calculated with close approximation by the following equation:

$R_c = \frac{2000 \times M \times K_r}{d}$	
$K_r = 1$	
$K_r = 1.25$	
$K_r = 1.5 - 2.0$	
M [Nm]	
d [mm]	

1.8.2.5 OVERHUNG LOADING VERIFICATION

	K_1							
x [mm] =	-50	-25	0	25	50	75	100	150
HDP 60	-	1.10	1.00	0.77	0.62	0.52	0.45	-
HDP 70	-	1.10	1.00	0.77	0.62	0.52	0.45	-

HDP 70	-	1.34	1.20	1.09	1.00	0.77	0.63	0.53	0.46	0.36	0.30	-
HDP 80	1.38	1.26	1.16	1.07	1.00	0.82	0.69	0.59	0.52	0.42	0.35	0.30
HDP 90	1.33	1.23	1.14	1.07	1.00	0.81	0.68	0.58	0.51	0.41	0.34	0.30

1.8.2.6 SHAFT LOADING

1. Overhung loads on output shaft

Refer to section 3.5.1, and verify that both the radial and the axial force acting onto output shaft do not exceed the maximum permitted for the selected product configuration. In addition to overhung load, thrust load may also be applied:

$$An_2 \leq 0.2 \times Rn_2$$

The HDB option provides higher capacity bearings to cater for particularly heavy external loads. If external loads exceed the capacity of even the heavy-duty bearings, consider providing external support for the drive shafts, reducing external loads or, if necessary, selecting a gear unit of the next size up.

When checking the overhung load capacity refer to scheme shown at paragraph 1.8.2.5. Calculate the admissible overhung load R_x that is relevant to the distance the force applies from shaft midpoint and compare this with the force R_c that acts onto the shaft.

Multiply the nominal radial load Rn_2 , as listed in the technical data section, for the load location factor K_2 to get the permissible overhung load R_{x_2} for the output shaft.

Rated overhung loads Rn are calculated for the most unfavourable condition as far as direction of rotation and the angle the force applies onto the shaft. Catalogue values are therefore conservative, for an in-depth calculation contact the Technical Service of

Bonfiglioli Riduttori.

When a radial force applies a thrust load $An_2 \leq 0.2 \times Rn_2$ is also permitted.

2. **Thrust loads on output shaft**

Refer to section [3.6.1](#) and verify that thrust force on the shaft does not exceed that specified in the chart for the selected product configuration and combination of direction of shaft rotation / direction of force.

If an overhung load is present in addition to the thrust load, contact Bonfiglioli Riduttori's Technical Service.

Permissible thrust loads refer exclusively to forces applying axially on the shaft. In case of forces applying offset please consult with Bonfiglioli's Technical Service.

3. **Overhung and thrust loads on input shaft**

When checking the overhung load capacity refer to scheme shown at paragraph [1.8.2.5](#). Calculate the admissible overhung load Rx that is relevant to the distance the force applies from shaft midpoint and compare this with the force Rc that acts onto the shaft.

Multiply the nominal radial load Rn_1 , as listed in the technical data section, for the load location factor K_1 to get the permissible overhung load Rx_1 for the output shaft.

Rated overhung loads Rn are calculated for the most unfavourable condition as far as direction of rotation and the angle the force applies onto the shaft. Catalogue values are therefore conservative, for an in-depth calculation contact the Technical Service of Bonfiglioli Riduttori.

When a radial force applies a thrust load $An_1 \leq 0.2 \times Rn_1$ is also permitted.

For gear units with double extended shafts (configurations LD, RD and DD) the permitted overhung load charted refers to shaft end highlighted in black in the scheme here below:

If an overhung load is applied to both shaft ends, contact Bonfiglioli Riduttori's Technical Service for advise.

1.8.3 LUBRICATION

Internal parts of HDP gear units are oil bath and splash lubricated. Upper bearings in the V5 mounting position are grease lubricated. In this case a Nilos ring retains the grease, unless forced lubrication by mechanical pump (OP1 and OP2 options) or motor pump (MOP option) is specified in the order. The gear units are supplied without lubricant. It is the customer's responsibility to fill the unit with the appropriate quantity of oil before start-up.

The quantities of lubricant given in the chart are indicative. Refer to the sight glass' centre line, or the dipstick if supplied, for correct filling.

The quantity of lubricant given in the chart may vary, sometimes substantially, depending on the gear ratio or a particular product modification.

	 [l]			
	B3	B6	B7	V5
HDP 60	10.0	14.8	14.6	16.0
HDP 70	10.5	15.5	15.3	16.7
HDP 80	16.1	23.8	23.5	25.6
HDP 90	22.9	33.8	33.4	36.5

Lubricant		kinematic viscosity at 40°C [cst]		
		ISO VG 220	ISO VG 320	ISO VG 460
Mineral Oil (EP additives)	Tamb	0°C ... 20°C	10°C ... 40°C	20°C ... 50°C
Synthetic oil	Tamb	0°C ... 30°C	10°C ... 50°C	-

Lubricant must be pre-heated through the appropriate electric resistance (HE option) in the following cases:

- operation at ambient temperatures lower than 0°C
- upon starting up gear units that are oil-bath and splash lubricated if the difference between the ambient temperature and the oil's pour point is greater than 10°C
- Upon starting up gear units with forced lubrication systems (options OP1, OP2 or MOP) if the oil viscosity exceeds 1800 cst. Depending of the type of lubricant used, this value may be produced with ambient temperatures between 10°C and 20°C approx.

1.8.4 SERVICE FACTOR

Service factors listed here under are empirical values based on AGMA and ISO specifications as well as our experience for use in common applications. They apply for state of the art-designed driven machines and normal operating conditions.

1.8.5 THERMAL CAPACITY

Checking the thermal capacity may not be necessary if the gear unit operates continuously for less than 3 hours followed by a rest time sufficient to restore the ambient temperature.

$$P_{T1} \leq (P_T \times f_{TA} \times f_{AMB} \times f_{ALT} - P_{T0} \times f_i \times f_{n1}) \times f_{INT} + P_{FAN} \times f_{TA} \times f_{ALT} + P_{SR}$$

Reference values	
Symbol	Definition
P_T	Base thermal capacity
P_{T0}	Equivalent thermal capacity under no load
P_{SR}	Additional thermal capacity linked to the use of the cooling coil
P_{FAN}	Additional thermal capacity linked to fan cooling

Adjusting factors	
Symbol	Relationship
f_i	factor depends on nominal gear ratio $[i_N]$
f_{n1}	factor depends on drive speed n_1 . Interpolate for intermediate speed values
f_{TA}	factor depends on ambient temperature t_a . Interpolate for intermediate values
f_{INT}	factor depends on the operating cycle per hour [ED%]. Interpolation is permitted
f_{AMB}	factor depends on the type of ambient the gear unit is installed into
f_{ALT}	factor depends on the altitude the gear unit operates at. Interpolation is permitted

1.8.6 EXAMPLE

Application data
$n_1 = 900$ min ⁻¹
$n_2 = 75$ min ⁻¹
$f_s = 2$
$P_{r2} = 25$ kW
Mounting position: B7
Operating cycle per hours: 100% ---> $f_{INT} = 1$

Environmental conditions
Ambient temperature = 30°C
large indoor space
altitude m.s.l.m. = 0 m
$f_{AMB} = 1$
$f_{TA} = 0.86$
$f_{ALT} = 1$

Product selection:

$$i = n_1 / n_2 = 12 \rightarrow i_N = 12$$

$$P_{r1} = P_{r2} / \eta = 26 \rightarrow P_{r1} = 26 \text{ kW}$$

$$P_{n1} \geq P_{r1} \times f_s = 52 \rightarrow P_{n1} \geq 52 \text{ kW}$$

Ordering numbers:

HDP 70 2 11.7 LP LR VP B7

Thermal capacity check:

$n_1 = 900$ min ⁻¹	$f_{n1} = 0.63$
HDP 70 2...B7	$P_T = 52$ kW
HDP 70 2...B7	$P_{T0} = 40$ kW
$i_N = 12$	$f_i = 0.85$

$$P_{r1} \leq (P_T \times f_{TA} \times f_{AMB} \times f_{ALT} - P_{T0} \times f_i \times f_{n1}) \times f_{INT} = 23.3 \text{ kW} < 26 \text{ kW} \triangle$$

Option 1 - Fan cooling **HDP 70 2** ---> $P_{FAN} = 10$ kW

$$P_{r1} \leq (P_T \times f_{TA} \times f_{AMB} \times f_{ALT} - P_{T0} \times f_i \times f_{n1}) \times f_{INT} + P_{FAN} \times f_{TA} \times f_{ALT} = 31.9 \text{ kW} > 26 \text{ kW} \odot$$

Option 2 - Cooling coil **HDP 70 2 ... B7** ---> $P_{SR} = 17$ kW

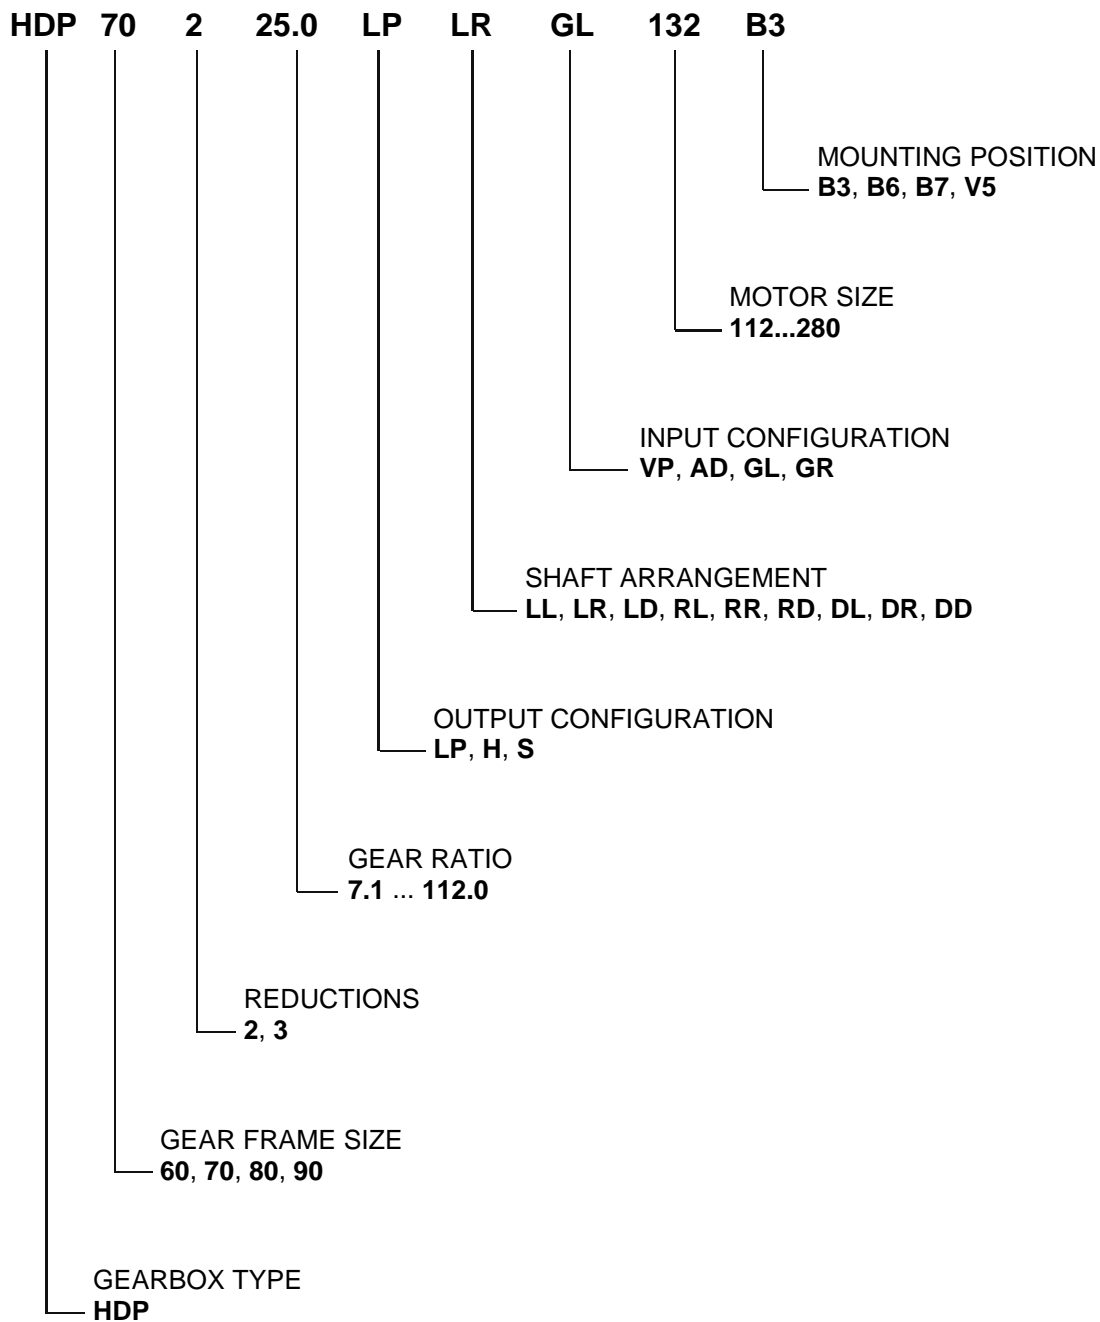

$$P_{r1} \leq (P_T \times f_{TA} \times f_{AMB} \times f_{ALT} - P_{T0} \times f_i \times f_{n1}) \times f_{INT} + P_{SR} = 40.3 \text{ kW} > 26 \text{ kW} \odot$$

2 PRODUCT CONFIGURATIONS

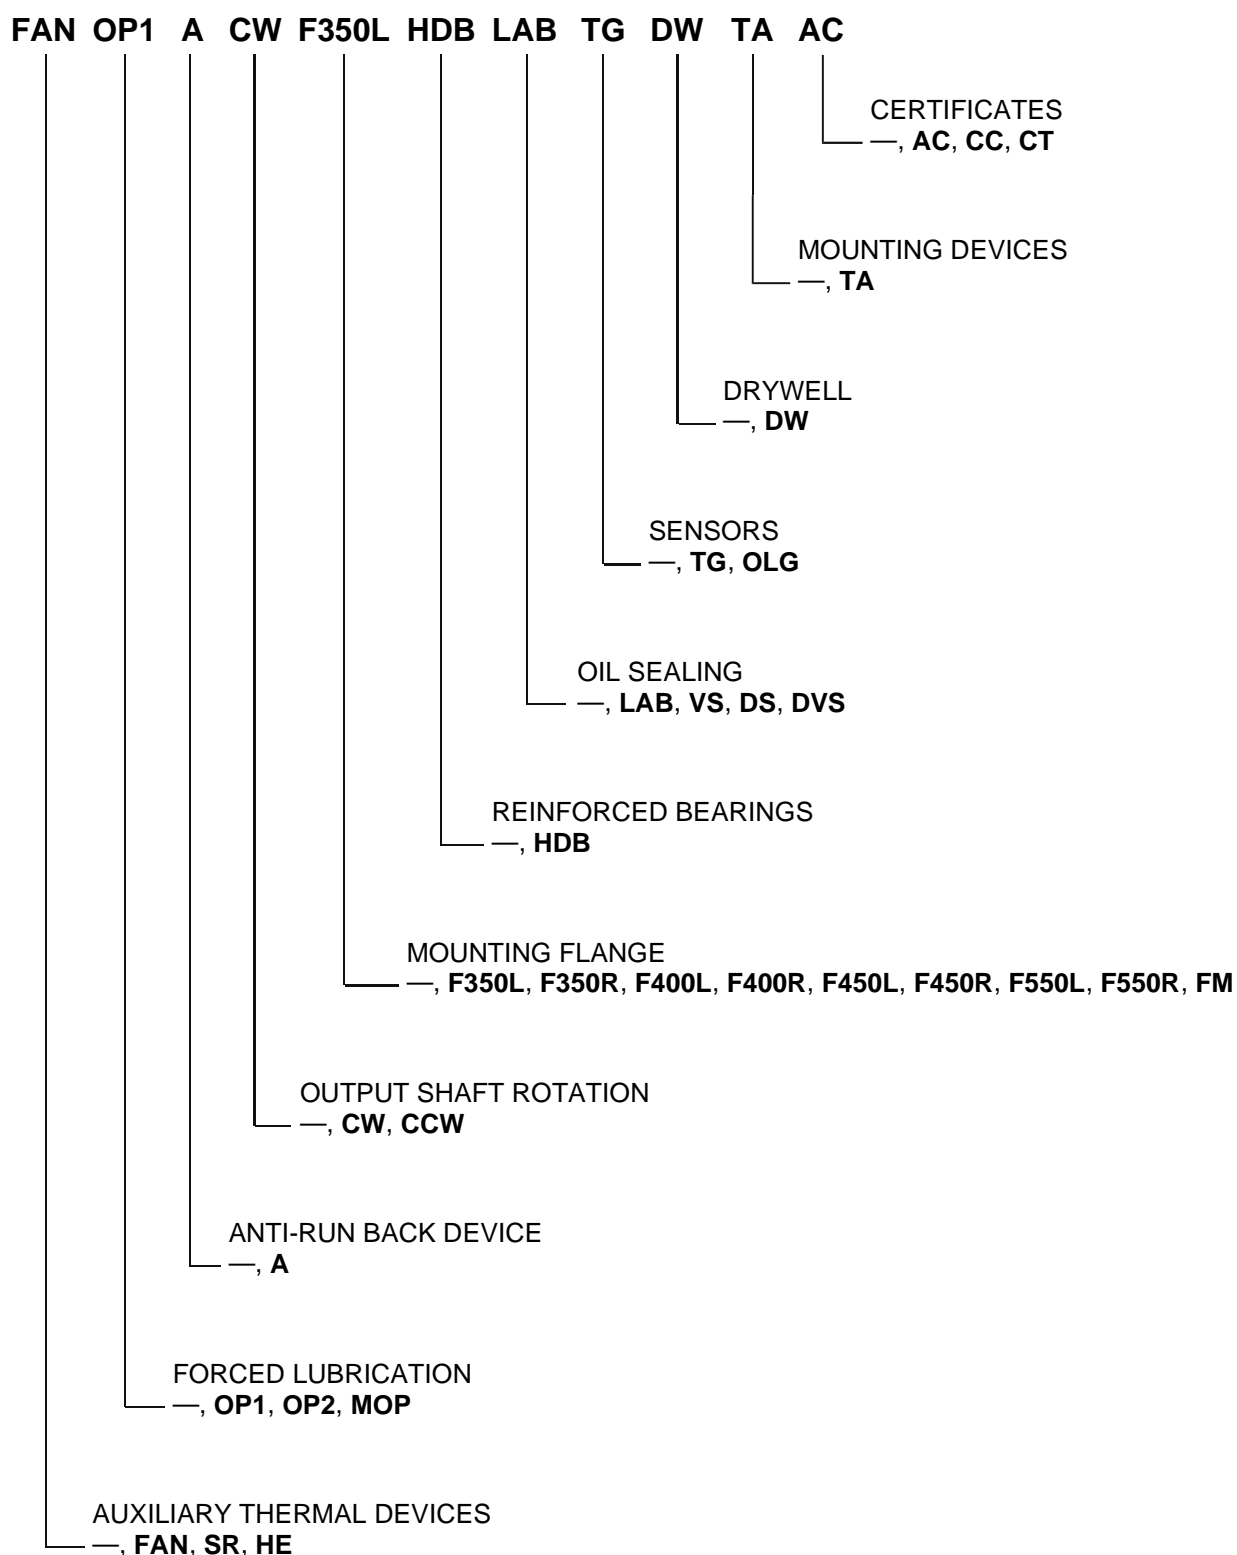

2.1 ORDERING NUMBERS

2.1.1 BASE VARIANTS

2.1.2 OPTIONAL VARIANTS

REMARK: The multiple selection of some of the variants may be subject to technical or dimensional constraints. Consult with the factory to have your selection approved.

2.2 MOUNTING POSITION

2.3 INPUT AND OUTPUT CONFIGURATION

2.3.1 OUTPUT CONFIGURATION

2.3.2 INPUT CONFIGURATION

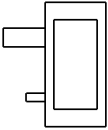

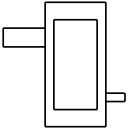

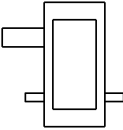

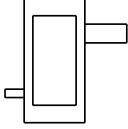

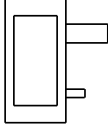

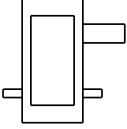

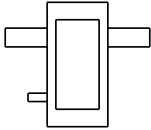

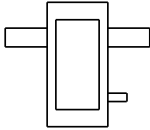

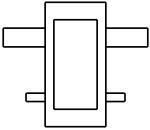

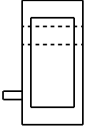

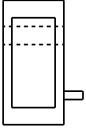

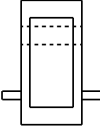

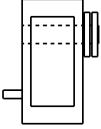

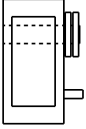

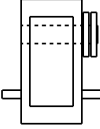

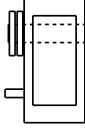

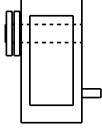

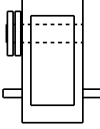

On the input side the gear unit can be arranged in either one of the configurations described here after:

- **Solid input shaft**, single- or double-sided – Specify **VP**
- **Motor flange mounting** for an IEC-standard electric motor with IM B5 flange. Drive is transmitted via the gear unit's keyed hollow input shaft. The option is only applicable to units HDP 60... HDP 90 in the triple reduction configuration – Specify **AD**.
- **Motor mounting through bell housing and flexible coupling**. The option is designated **GL** or **GR** depending on what side of the gear unit the coupling is mounted. The flexible coupling is within the scope for supply.

2.3.3 SHAFT ARRANGEMENT

	VP - GL - AD	VP - GR - AD	VP - GL - GR
LP	 LL	 LR	 LD
	 RL	 RR	 RD
	 DL	 DR	 DD
H	 LL	 LR	 LD
S	 LL	 LR	 LD
	 RL	 RR	 RD

2.4 MOTOR AVAILABILITY

The following charts list the motor/gearbox combinations that are geometrically feasible. Variants are only applicable if either an AD (direct motor mounting) or a GL / GR input configuration (coupling through bell housing and flexible coupling) were previously specified within the ordering code.

Because of standardisation, the rated power of the electric motor selected might be greater than power Pr_1 actually requested by the application. Make sure that the electric motor will never develop the extra power at any stage of the operating cycle. If you have any doubts about the validity of the application data, or uncertainty concerning the actual load pattern, install a torque limiting device or proportionally revise the applicable service factor.

	Input configuration AD						
	112	132	160	180	200	225	250
HDP 60 3	x	x	x	x			
HDP 70 3	x	x	x	x	x

2.5 OPTIONAL VARIANTS

2.5.1 AUXILIARY COOLING DEVICES

2.5.1.1 FAN COOLING

If the **FAN** option is specified, a cooling fan is keyed to the end of the input shaft opposite the drive side. This option is not available with other configurations that use the same shaft end and with variants MOP - forced lubrication with motor pump - and LAB - labyrinth oil seals. The increased cooling effect obtained by this option is shown by the thermal capacity value P_{FAN} . See the section, [1.8.5](#).

The efficiency of the fan is greatly reduced at drive speed lower than $n_1 = 900 \text{ min}^{-1}$. Should this be the case the cooling coil is recommended instead as the device that best increases the heat dissipation when the mechanical power is greater than thermal capacity.

	A	B	C	D
HDP 60_FAN	125	130	255	200
HDP 70_FAN	125	130	255	200
HDP 80_FAN	155	155	348	235
HDP 90_FAN	178	178	360	260

2.5.1.2 COOLING COIL

The cooling coil option **SR** is designed for integration in a cooling circuit to be provided by the installer. The water supply circuit must correspond to the following specifications: maximum pressure 8 bar, flow rate 5 l/min, maximum delivery temperature 20°C. The increased cooling effect obtained in these conditions is shown by the thermal capacity value P_{SR} . See the section, [1.8.5](#).

	A	B
HDP 60_ SR	147	170
HDP 70_ SR	147	170
HDP 80_ SR	173	190
HDP 90_ SR	190	210

2.5.1.3 HEATERS

In very low ambient temperatures it may prove necessary to pre-heat the lubricant in the sump before start-up and/or during operation. The **HE** option envisages the installation of an electrical heating element, supplied with a thermostat to detect when the minimum temperature needed for correct operation has been reached. The wiring necessary for the thermostat must be provided by the installer.

2.5.2 FORCED LUBRICATION

2.5.2.1 MECHANICAL PUMP

In continuous duty applications and V5 mounting position installations, an optional forced lubrication circuit is available on request, complete with a pump keyed to the shaft end opposite the drive side. This system ensures adequate lubrication of the top bearings. When ordering, specify the pump type - **OP1** or **OP2** – to suit drive speed n_1 . See the table below. This option is not available with other configurations that use the same shaft end.

- 1 - Pump
- 2 - Filter
- 3 - Oil flow visual indicator

	$n_1 = 900 \text{ min}^{-1}$	$n_1 = 1100 \text{ min}^{-1}$	$n_1 = 1400 \text{ min}^{-1}$
HDP	OP2	OP2	OP1
	A	B	
HDP 60_ OP1	190	105	
HDP 60_ OP2	190	105	
HDP 70_ OP1	215	105	
HDP 70_ OP2	215	105	
HDP 80_ OP1	240	105	
HDP 80_ OP2	240	130	
HDP 90_ OP1	240	130	
HDP 90_ OP2	240	130	

The chart shows the applicability for the pump depending on the input and output configuration.

	LL RD DL	LR RR DR	LD RD DD
LP	⊖	VP GR AD	⊖
H	⊖	VP GR AD	⊖
S	⊖	VP GR AD	⊖

2.5.2.2 MOTOR PUMP

For intermittent duty applications and V5 mounting position installations, a forced lubrication circuit is available on request, complete with an independently powered motor pump. This system ensures a constant oil flow to the top bearings. Specify the **MOP** option.

Option MOP is not available if fan cooling - option FAN - is also specified.

- 1 - Motorpump
- 2 - Filter
- 3 - Minimum pressure switch

	A	B	C
HDP 60_ MOP	190	225	310
HDP 70_ MOP	215	225	330
HDP 80_ MOP	240	270	355
HDP 90_ MOP	240	285	390

The chart shows the applicability for the motorpump depending on the input and output configuration.

	LL RL DL	LR RR DR	LD RD DD
LP	VP	VP GR AD	VP GR
H	VP	VP GR AD	VP GR
S	VP	VP GR AD	VP GR

2.5.3 BACKSTOP DEVICE

The backstop device ensures that only one direction of rotation is allowed, and prevents the gearbox to be backdriven by the load connected to the output shaft.

In addition to verifying the shock loads shown in section 1.8.2.1, also make sure that the torque transmitted to the backstop $M_1 = M_2 / (i \times \eta)$ is less than the admissible torque M_{1max} listed in the chart below.

A drive speed $n_1 \geq 800 \text{ min}^{-1}$ will ensure the optimal operation for the device.

The backstop is keyed to the input shaft opposite the drive end and it is accessible for inspection.

Along with the specification of the backstop device, option **A**, the direction of free rotation for the output shaft (**CW** or **CCW**) must also be specified in the order.

This option is not available with other configurations that use the same shaft end.

	i	A	B	M_{1max} [Nm]
HDP 60_ A	7.1 ... 15.2	125	202.5	800
	17.3 ... 98.4	100	197.5	375
HDP 70_ A	8.0 ... 17.7	125	202.5	800
	19.4 ... 114.4	100	197.5	375
HDP 80_ A	8.1 ... 22.6	130	233	912
	25.8 ... 111.4	110	228	550
HDP 90_ A	7.9 ... 22.4	150	261	1400
	25.4 ... 110.1	125	256	800

2.5.4 REINFORCED BEARINGS

Optional heavy-duty bearings are also available, with increased overhung load capacity. The **HDB** option can only be applied to units with an LP version solid output shaft.

See the relevant section in this catalogue for precise overhung load values.

Option cannot be specified along with variants DW -drywell- or LAB -labyrinth seals-.

2.5.5 SEALS AND GASKETS

On request, gearboxes can be equipped with different oil sealing systems. These are:

LAB – Standard oil seals on each shaft are replaced by non-contacting seals, labyrinth type, that are wear- and maintenance-free. The option only applies to configurations featuring solid input shaft, type VP, exclusively in the B3 mounting position.

Option cannot be specified along with variants FAN -fan cooling-, HDB -reinforced bearings- and OLG -oil level indicator.

VS – Viton® compound seal rings

DS – Dual set of seal rings at each shaft end

DVS – Dual set of Viton® compound seal rings at each shaft end.

2.5.6 SENSORS

Bimetal thermostat – If the **TG** option is specified, a bimetal thermostat is supplied to prevent the oil to exceed the set temperature of $90^{\circ}\text{C} \pm 5^{\circ}\text{C}$. The device is supplied with the gear unit, but installation and wiring are the responsibility of the installer.

Oil level indicator – If the **OLG** option is specified, the gearbox is supplied with a device permitting remote control of the oil level. The device best operates when the gearbox is idle and should be bypassed when the gearbox is operating. Wiring is the responsibility of the installer.

Variant not available along with the DW -dry well- and LAB -labyrinth seals-

2.5.7 DRYWELL

The “drywell” device, option **DW**, is only available for the V5 vertical mounting position, and ensures the oil-tightness of the output shaft.

When specified, it necessarily requires the installation of a forced lubrication system, selected from those available for the gearbox, as illustrated in the relevant section of this catalogue.

At scheduled intervals, check and refill the grease in the vane underneath the output shaft's bottom bearing.

Option cannot be specified along with variant LAB -labyrinth seals-.

The chart shows the applicability for the drywell depending on the input and output configurations.

2.5.9 CERTIFICATES

AC - Certificate of compliance

The document certifies the compliance of the product with the purchase order and the construction in conformity with the applicable procedures of the Bonfiglioli Quality System.

CC - Inspection certificate

The document entails checking on order compliance, the visual inspection of external conditions and of mating dimensions. Checking on main functional parameters in unloaded conditions is also performed along with oil seal proofing, both in static and in running conditions. Units inspected are sampled within the shipping batch and marked individually.

CT - Type certificate

Further to the activities relevant to the Inspection certificate the following checks are also conducted:

- noise
- surface temperature
- tightness of external hardware
- functionality of ancillary devices, if fitted

All checks are conducted with the gear unit running unloaded. Units inspected are sampled within the shipping batch and marked individually.

-  Shaft the rated overhung load is applicable to. For double extended shaft the load is only applicable to the extension highlighted. Should this not be the case consult Bonfiglioli's Technical Service.
-  Rated overhung loads relevant to reinforced bearings type HDB.

Rated thrust loads relevant to reinforced bearings type HDB.

3.7 MASS MOMENT OF INERTIA

Moments of inertia are relevant to gear unit's input shaft and to product configuration correspondent to the combination: LP-LR with single-sided input shaft.
